Technical Skills

Languages: GO | Python | C++ | Bash

Databases: MySQL | PostgreSQL | SQLite | Redis | Non-Relational

Developer Tools: AWS | Jenkins | Terraform | Kubernetes | Docker | Git | Linux | Agile | Proxmox | VMWare | KVM

Workflows: Scrum Master | Kanban

Work Experience

Software Engineer - DevOps & SecOps **May 2021 – October 2025**

Security Compass *Toronto, Ontario*

Utilizing varying technologies and methodologies I have consistently delivered software solutions ranging in usecase from greenfield custom integrations to supporting legacy SAAS systems. Directly contributing to discussions with **senior leadership** acting as an SME for various internal and external initiatives.

- Lead **enterprise client** engagements involving the **scoping, development (Kubernetes/Docker) and adoption** of custom security solutions/automations **shipped at scale and integrated into production** environment
- Shipped client security pipeline automation that scans all committed and existing code to create tickets in associated Azure DevOps epics automatically to mediate detected vulnerabilities. **Used across all development teams**
- Engineered internal **cloud management system** adopted by sales, engineering, product, and services teams using **AWS infrastructure** which **reduced deployment times by 95% & $10,000/month** for all testing/demo instances
- Shipped **C++ API load testing** tool used in ensuring integrity of all customized client solutions by **stress & sanity testing networked components** and lead cross-team partnership with the DevOps team
- **Developed and managed Jenkins pipelines** used for performing automated tests, deployments, and management of **AWS** resources. Pipelines mainly utilize **Groovy, Terraform, and Ansible** along with supporting technologies
- **Lead and mentored five developers** regarding skill improvement and career goals. The team creates custom enterprise automations which **reduce time** to threat model by **50%**
- I am my teams **Scrum Master** and perform regular **code reviews and tests** for internal/externally shipped code ensuring security/quality standards are met. Tests include **regression, unit, end-to-end, and security scanning**

Software Development Researcher **Sept 2020 – Jan 2021**

Seneca College, Center for Development of Open Technology *Toronto, Ontario*

Interned in the college research division working on software collaborations with industry partners on our high availability systems simulation platform.

- Refactored **Open-Source** codebase from **Python 2 to Python 3** by reworking existing modules and packaging pipeline which lead to it **working on modern versions of RHEL**
- Implemented **Jenkins pipeline** to automatically package new builds of the **open source dependencies** which **eliminated manual effort completely**
- Refined dependencies for a hardware simulation tools Open-Source code-base by reducing bloat, having a **reduced footprint by 60%** through refactoring existing logic to function at a more favorable run time

Education

Seneca Polytechnic College **2021**

Bachelor of Information Security — Minor Secure Software Development *Toronto, Ontario*

- Academic Scholarship — **GPA: 3.71**
- Courses: Security systems Architecture, Software Engineering, Malware Analysis, Scalable Automation, Operating Systems, Computer Architecture, Cryptography, Network Security, Risk Management and Compliance

Seneca Polytechnic College **2018**

Associates Degree of Computer Networking *Toronto, Ontario*

- Academic Scholarship — **GPA: 3.74**
- Courses: Network architecture, Computer Hardware, Server Optimization, Cloud Infrastructure, Open Systems Administration, Wireless Networks, Advanced Databases

Projects

Papy - API Load Testing & Data Generation Tool | *Article* | *Source Code* **C++**

- **Solely developed & deployed** API load testing and data generation tool capable of 100,000+ requests per second
- Used for **testing Security Compass internal and external API endpoints**
- Developed in **C++** and designed to have **minimal external dependencies** allowing for ease of maintenance and easily built across multiple platforms

League of Legends Match Tracker | *Source Code* **Python | Docker | AWS | C++ | Cloudflare**

- Deployed a **Full-Stack** web application which serves **1,000+ unique visitors a month**
- Front end developed with **no framework**. Pure Javascript, HTML, and CSS was used
- Utilized **MySQL** for data storage, and a **custom built C++ load testing tool** which can **simulate 100,000 requests/second**

Software Development Based Youtube Channel | *BernaBuilds*

· YouTube channel dedicated to software development and creating content related to important computer science related principles as well as my personal projects.
· Personal favorite - Discussion with Max Stewart from Riot Games about architecting systems at scale

Leadership

Security Compass Jr. Engineer Mentoring **Jun 2023 – Present**

Mentor junior engineers related to technical aspects of career advancement, organization specific goals, and **skill growth**.
